I. LESSON INTRODUCTION**A. Self Introduction**

1. Name
2. Phone number
3. Background

B. Motivation

1. Radiation sources are not limited to nuclear facilities.
The study of sources provides data for:
 - a. Basis for occupational exposures
 - b. Effects from high source exposures
 - c. Assesses impact from nuclear facilities
 - d. Determines use of building materials

C. Overview of Lesson

1. Terrestrial radiation
2. Cosmic radiation
3. Internally emitted radiation
4. Inhaled radionuclides
5. Nuclear fallout
6. Medical exposures
7. Consumer products
8. Nuclear facilities

D. Introduce Objectives

O.H.: Objectives

II. LESSON OUTLINE**A. NATURAL BACKGROUND RADIATION SOURCES****1. Terrestrial Radiation**

- a. Earth
 - 1) Source - small amounts of radioactive material found in rock and soil

Objective 1.05.01 a.

Explain: Different books will use other dose rates. The references used here are NCRP reports.

- 2) Major isotopes: Uranium and Thorium
 - 3) Exposure dependent on location
 - Atlantic and Gulf coastal = 15-35 mrem/yr
 - Greater U.S. = 35-75 mrem/yr
 - Colorado Plateau = 75-140 mrem/yr
 - 4) Exposure dependent on type of soil
 - Volcanic - 125 mrem/yr
 - Sandstone - 50 mrem/yr
 - Limestone - 25 mrem/yr
 - 5) U.S. average: 1 sq mile 1 ft deep contains
1 ton K-40, 3 tons U-238, 6 tons Th-232
 - 6) Extremely high locations - due to high concentrations of monazite:

Monazite: a Thorium Mineral

 - Kerala India - Population is 70K
 - 16K receive >500 mrem/yr
 - 500 receive >2,000 mrem/yr
 - Highest: 5,865 mrem/yr
 - Minas Gerais Brazil
 - Average: 1,160 mrem/yr
 - Max: 12,000 mrem/yr
- b. Radioactivity in Air
- 1) Produces <5% of total external terrestrial exposure
 - 2) Majority of exposure for internal is radon
 - 3) Cosmogonic Sources: C-14, H-3, Na-22
Be-7, from cosmic interactions, very small contribution.
- c. Radioactivity in Water
- 1) All water contains some radioactivity
 - 2) Examples
 - Sea water contains K-40
 - Natural springs contain U and Th

Rainwater picks up radioactivity from the air

Ground water picks up radioactivity from the soil

Contributor to internal doses

- d. U.S. national average from terrestrial (NCRP Report No. 95) is **28 mrem/yr**

2. Cosmic Radiation

Objective 1.05.01 b.

- a. Natural radiation originating from outside of our atmosphere
- b. Discovered during early terrestrial experiments with weather balloons
- c. Primary

1) Galactic Cosmic Rays

From outside the solar system

Positively charged particles

- 87% protons
- 11% alpha
- 2% misc.

High energies - up to 10^{20} eV

2) Geomagnetically Trapped

When galactic rays approach earth, they must have enough energy to pass through magnetic fields

If they lack enough energy, they become trapped in two energy bands

- 1K - 3K meters
- 12K - 15K meters

3) Solar Cosmic Rays

Produced by severe solar flares

Consist mainly of protons

High energy - detected on ground

Low energy - detected at high alt.

Measurements

- 30,000 ft - 100 mr/hr
- 80,000 ft - 10 R/hr

Concern for high altitude space travel

d. Secondary

- 1) Results from the interaction of primaries with the earth's atmosphere
- 2) Cascade effect: one primary ionization = 100 million secondary ionizations
- 3) Products produced: pions, muons, electrons, photons, protons, neutrons
- 4) Primaries absorbed within the upper 10% of the atmosphere
- 5) Dominant components at ground level are penetrating muons and the electrons they produce.
- 6) Latitude contributes a small factor due to the earth's magnetic field
- 7) Exposures increase with altitude, decrease with latitude (Denver 50 mr/yr cosmic)
- 8) U.S. average = **27 mrem/yr**

3. Internal Emitters (Food Chain)

Objective 1.05.01 c.

- a. Results from the transfer of natural radiation from the food chain to man
- b. Deposited internally from trace amounts found in soil, water and air
- c. Isotopes: Primary - K-40
others - Rb-87, Ra-226, U-238, Po-210, C-14
- d. U.S. average of alpha emitters in water is <1pCi/l
 - Colorado - 40-50 pCi/l
 - Brazil - 240 pCi/l (Bottled Water)
 - Helsinki - 240 rem to lung from Radon

- e. U.S. national average is **39 mrem/yr** from Internal Emitters

4. Inhaled Radionuclides

Objective 1.05.01 d.

- a. Due mostly to Radon and thoron gas
- b. Radon is a product of the U-238 Series
 $U-238 \rightarrow Th-234 \rightarrow Pa-234 \rightarrow U-234 \rightarrow Th-230 \rightarrow Ra-226 \rightarrow \underline{Rn-222}$
- c. Thoron is a product of the Th-232 series
 $Th-232 \rightarrow Ra-228 \rightarrow Ac-228 \rightarrow Th-228 \rightarrow Ra-224 \rightarrow \underline{Rn-220}$
- d. U and Th are present all over. Daughter products diffuse to the surface. These gases attach themselves to dusts and aerosols which are inhaled.
- e. Radon concentrations are based on amounts of U and Th in the area
- f. Factors:
- Weather (inversions)
 - Indoor insulation
 - Ventilation rate
- g. High Areas:
- Colorado (Grand Junction) - mine tailings
 - Pennsylvania - High radium concentration
 - Underground mines, caves, caverns, etc...
- h. U.S. national average for Inhaled Radionuclides is **200 mrem/yr.**

Most has been removed

B. MAN MADE BACKGROUND RADIATION SOURCES

1. Nuclear Fallout

Objective 1.05.02 a.

- a. Refers to the debris that settles as a result of weapons testing
- b. Contains over 200 fission products, bomb parts and all near-blast matter.

- c. Dispersement is a function of:
 - 1) Bomb yield
 - Kiloton Range - troposphere, 9,000 - 17,000 meters - easily washed down
 - Megaton Range - Stratosphere, may stay aloft for five years
 - 2) Types of blast
 - Surface burst
 - Above ground
 - 3) Meteorological Factors - (weather)
- d. Weapons test ban treaty of 1962-63 limited testing
- e. U.S. average from nuclear fallout is <1 mrem/yr (NCRP #93)

2. Medical Exposures

Objective 1.05.02 b.

- a. Diagnostic X-rays
 - 1) Over 300,000 X-ray units in the U.S., about 67% of adult population is exposed each year
 - 2) X-ray machines consist of:
 - a) X-ray tube
 - b) HV Supply
 - c) Filament
 - d) Shielding
 - 3) Three general types:
 - a) Radiography - X-ray tube and a photographic plate (Chest, Dental)
 - b) Fluoroscope - Uses an image intensifier, observes internal processes
 - c) Photofluorographic - Fluorescent screen and camera, large amounts of people
 - 4) U.S. national average from diagnostic X-rays is 39 mrem/yr

b. Medical Radionuclides (Two Types)

1) Nuclear Medicine

Used to diagnose medical problems

Attaches a radionuclide to a pharmaceutical that will seek a particular organ

Radionuclide selection:

- Photon emitter
- Short lived
- Tc-99m, In-113m

2) Radiation Oncology

Uses high energy power source to treat tumors

Typical 6,000 Curie Co-60 source delivers 100 Rad/min

3) NCRP report 93 gives the dose equivalent for medical radionuclides as **14 mrem/yr**

c. Both contributors to Medical Exposures combine for 53 mrem/yr major types of medical exposures

3. Consumer Products (NCRP Report 56)

Objective 1.05.02 c.

a. Television (Example)

- 1) Source - X-rays from High Voltage a few.
- 2) Limit (1960) - 0.5 mr/hr at 5 cm
- 3) 1967 - 149 big screen TVs were recalled, 2 emitted greater than 100 mRad/hr
- 4) U.S. average - 0.5 to 1.5 mr/yr

b. Shoe fitting fluoroscopes (Example)

- 1) Source - X-ray tube
- 2) 1953 - 10,000 in use
- 3) Exposures - 7 to 14 R per 20 sec exposure
GSD - 30 to 170 mr

c. Radioluminous Watches (Example)

- 1) Source - Ra-226 "Glow in the Dark"
- 2) 10,000,000 still in use
- 3) Pr-147 and H-3 used today
- d. Dental Prosthesis (Example)
 - 1) Dentures used to be doped with U resulting in up to 600 rem/yr to the oral mucosa
- e. Hundreds of other products contribute
 - 1) U.S. national average from all consumer products is **10 mrem/yr**

4. Nuclear Facilities

Objective 1.05.02 d.

- a. Public exposures from
 - 1) Mining (several hundred) and milling (20 mills)
 - 2) Fuel Fabrication (21 facilities)
 - 3) Reactors (~90 power, 300 non-power)
- b. U.S. national average - **<1 mrem/yr**

III. SUMMARY**A. Review major topics**

- 1. Terrestrial radiation
- 2. Cosmic radiation
- 3. Internally emitted
- 4. Inhaled radionuclides
- 5. Nuclear fallout
- 6. Medical exposures
- 7. Consumer products
- 8. Nuclear facilities

B. Review learning objectives**IV. EVALUATION**

Evaluation shall consist of a written examination comprised of multiple choice questions. 80% shall be the minimum passing criteria for the examination.

1.05: SOURCES OF RADIATION
